ALPHA-X

COMPLETELY REMASTERED.

New Ball Joint and Lock-Up Mechanism

The ball joint of the ALPHA-X offers a wide range of motion, allowing you to position your holster at just the right angle. This holster uses a much larger ball joint and a pressure lug lock-up, which locks the ball firmly without marking or damaging it. With this system even the smallest adjustments are always possible.

The ball joint is now located higher up, closer to the center of the holster. This reduces the torque and forces applied, contributing to the solid rigid feel of the holster.

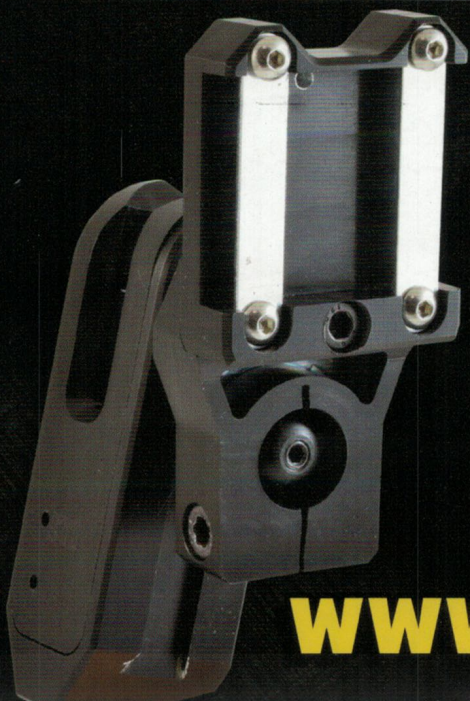

A large easy-to-reach one-screw locking system allows you to adjust the holster position even when wearing it.

The Same Race Master Insert Blocks!

The ALPHA-X utilizes the same successful magnetic insert blocks used by the latest generation Race Master Holster. An ALPHA-X Holster can be purchased with or without an insert block, making the upgrade easier and more affordable for shooters already using our Race Master Holsters.

Body Rail Height Adjustment

The ALPHA-X achieves its height adjustment by means of a rail built directly into the side of the holster body itself. This offers an extended range of adjustment and again reduces torque and forces applied. Here too the lock up is achieved by an expanding dovetail mechanism that does not mark or damage the rail.

Detachable Belt Hanger

The ALPHA-X has a two-piece belt hanger which can be dismantled by opening a single screw, allowing all position settings to be maintained while removing the holster body from the belt for easier space-saving transport.

Interchangeable Color Logo Inserts

The ALPHA-X is available in black anodize only, with an assortment of optional color inserts for the hanger and body logos. You can change these laser-cut plastic inserts whenever you choose.
